

Vibe Analytics — Coordinator Cheat Sheet

Keep this page on you. You are not expected to know the material — you're triaging errors so Rob can keep teaching.

If you can only be in the room for three windows, make it these: (1) Arrival — 15 min before 0:00 · (2) Build — 1:30-2:15 · (3) Ablation — 2:15-2:35

Where your time matters most

TIME	BLOCK	PRIORITY	WHY
before 0:00	Arrival / setup	Critical	Every known setup failure surfaces here
1:30-2:15	Build	Critical	Longest block, most hands-on, Rob can't reach everyone alone
2:15-2:35	Ablation	High	Everyone runs a script at once — this is when laptops break
1:00-1:30	Validate	Medium	JSON typos are the predictable failure here
0:40-1:00	Define	Low	Writing, not querying — lower technical risk
0:00-0:40	Framing + Demo	Low	Rob presents solo; nothing for you to do
2:35-3:00	Operationalize + Wrap	Low	Talk-through, lowest stakes

If you see this error, do this

WHAT'S ON SCREEN	FIX
" ModuleNotFoundError " after clicking a green play button	They ran it from VS Code's play button, not the terminal. Have them open the terminal and type <code>python explore.py</code> (or whatever the file's called) instead.
" ANTHROPIC_API_KEY not set "	Their terminal session lost the key (closing/reopening the terminal does this — expected). <code>\$env:ANTHROPIC_API_KEY = "their-key-here"</code>
" credit balance is too low "	Their API account has no funds. Hand them one of Rob's spare keys — ask Rob where they are before the workshop starts.
401 error / "credentials not correct" during install	Corporate network blocking pip's default source. <code>python -m pip install -r requirements.txt --index-url https://pypi.org/simple/</code>
" No eval found at ... "	They haven't saved their file yet, or saved it in the wrong place. It must be <code>evals/my-eval.json</code> exactly — check for a typo like <code>my-evals.json</code> (extra s).
" isn't valid JSON "	The error names the exact line. Usually a trailing comma after the last item in a list, or single quotes instead of double.
" No reference doc found "	Their file isn't named exactly <code>attrition.md</code> , <code>compensation.md</code> , or <code>engagement.md</code> inside <code>references/</code> .
" Cannot open file ... used by another process "	A database viewer (VS Code's DBCode extension) has a lock on the file. Close that tab, or restart VS Code.
Stuck on the Gotchas section, 8+ minutes, no progress	Hand them the Starter Queries printout for their domain (Attrition / Compensation / Engagement) — kept in your folder, not handed out by default.

What you're carrying

Spare data dictionaries — hand to anyone who lost theirs or a walk-in
Starter Queries handout (all 3 domains) — fallback only, give out when someone's stuck, not proactively
2-3 spare API keys (ask Rob before start) — for "credit balance too low" or a dead key

You don't need to understand SQL, JSON, or the skills to help here — every fix above is copy-paste. Not on this sheet? Find Rob.
