

Contributing Your Doc — No Git Required

You never used git before today. That's fine — everything below happens in your browser.

You don't need to "fork" anything yourself. When you upload a file to a repo you don't have write access to, GitHub automatically makes you a copy (a "fork") and sets up the pull request for you. One flow, no extra steps.

The 8-click version

1 Have a GitHub account

No account? Go to `github.com` and sign up — free, about a minute. Skip if you already have one.

2 Go to the repo

In your browser: `github.com/RobStilson/analytics-skills`

3 Open the references folder

Click it in the file list on the repo's main page.

4 Click **Add file** → **Upload files**

Above the file list. Or just drag your file straight into the browser window — that works too.

5 Drag in your reference doc

The file you saved in Build — `attrition.md`, `compensation.md`, or `engagement.md`.

6 Scroll down, write a one-line summary

Something like: `Add [domain] reference doc`. This becomes the title of your contribution.

Pick "Create a new branch and start a pull request"

7 GitHub shows this option since you don't have direct write access. It's usually already selected — if you see it, you're on the right path.

8 Click **Propose changes**, then **Create pull request**

First click stages your change. Next screen is the actual pull request — click the green button and you're done.

What happens next

Your PR shows up in the repo's **Pull requests** tab. Rob reviews it and merges when he can — could be the same day, could be after the conference. Your name goes in the README's Contributors section once it's merged.

Not comfortable making a GitHub account?

Totally fine. Email your `references/<domain>.md` file to Rob directly, and he'll add it with your name credited. No account, no browser flow — just an attachment.

If you get "This file already exists" — someone else in the room may have picked the same domain and already opened a PR for it. That's fine: mention it to Rob, and either compare notes with them or hold onto your version to send separately.
